INTRODUCTION

From 8 January - 7 February 1993 a multidisciplinary cruise was conducted aboard the RV *Polar Duke* as part of the Palmer Long-Term Ecological Research (LTER) program off the Antarctic Peninsula. Stations were occupied at specified grid locations (Figure 1) within the Palmer LTER survey grid (Waters and Smith, 1992). The cruise departed from Punta Arenas, Chile (1 January) and returned to Palmer Station, Antarctica (7 February).

Temperature profiles were collected using a Sippican, Inc. MK-9 expendable bathythermograph (XBT) system. Upon return from the cruise, the XBT data were processed by LTER personnel at the Center for Coastal Physical Oceanography (CCPO). Tapes of these data at one-meter resolution have been sent to the National Oceanographic Data Center.

SAMPLING PROCEDURES AND QUALITY ASSURANCE

XBT drops were made at 118 stations, of which 96 provided good data. The Sippican probes, either T-6 (nominal maximum depth: 460 m) or T-7 (nominal maximum depth: 760 m), were dropped from a hand-held or deck-mounted launcher while underway. The raw voltage data were logged directly to a computer disk file under the control of the MK-9 hardware and software configuration provided by Sippican, Inc.

Horizontal spacing between the XBT stations was 20 km on most transects; alongshelf spacing between transects was 100 km (Figure 1). Temperature profiles were also collected using a CTD sensor mounted on a Bio-optical Profiling System (BOPS) at stations offset 10 km from the XBT stations. The CTD temperature data from the BOPS casts are presented in a separate report (CCPO Technical Report No 93-02).

The raw voltage data were converted using MK-9 post-processing software to generate vertical profiles of temperature ($^{\circ}$ C). Each profile was plotted and visually inspected. Bad XBT casts or bad sections of individual casts were identified by comparing the XBT-derived temperature with known ranges of temperature for the study region. Those casts or subsections of casts that failed this comparison were eliminated. Bad subsections of a cast were typically the result of interference by ice or wind blowing the XBT wire against the hull of the ship. Also, vertical plane temperature contours along each across-shelf transect were generated using CTD and XBT data. XBT temperatures which were obviously different from adjacent CTD-derived temperatures were discarded. Typically temperatures within the top few meters were unrealistic due to the initial adjustment of the XBT thermistor to the cold water. Thus, the top 5 meters of each XBT cast were deleted. The edited data were smoothed (running average over 5 meters) and interpolated using a cubic spline to the standard depths that are reported in the following tables.

GRAPHICAL AND TABULAR DATA CHARACTERISTICS

A reference list of all XBT stations is presented in Table 1. The remainder of this data report presents graphical and tabular representations of station information and temperature measurements. For each station, a table of station information is provided as described below.

- Station and event numbers (in parenthesis to the right of the station number) are given for each station. The event number is an unique number assigned to each shipboard activity.
- Latitude and longitude locations correspond to the navigational fix, from the FURNO GPS receiver system, at probe launch time.
- Bottom depths in meters were determined acoustically with the 50kHz Digitrak system available on the ship.
- The day the station was occupied is reported in Julian Days.
- Time is given in Greenwich Mean Time and corresponds to probe launch time.

The second table for each station provides the temperature, given in degrees Celsius at:

- 10-m intervals from 5 to 160 m,
- 20-m intervals from 160 to 500 m,
- 50-m intervals deeper than 500m, and
- the last depth sampled.

For each station, a vertical profile of temperature is given to 600 meters. Fewer than 20 stations were deeper than 600 meters. For these stations, temperatures beyond 600 m are given in the tabular data listing for the standard depths.

ACKNOWLEDGMENTS

This work was supported by the National Science Foundation grant DPP-9011927. We thank Tim Newberger, Jaime Marquez, Brad Seibel and Michael Hearne for assistance in data collection on board the ship.

Waters, K. J. and R. C. Smith. 1992. Palmer LTER: A sampling grid for the Palmer LTER program. *Antarctic Journal of the U. S.*, 27, 236-239.

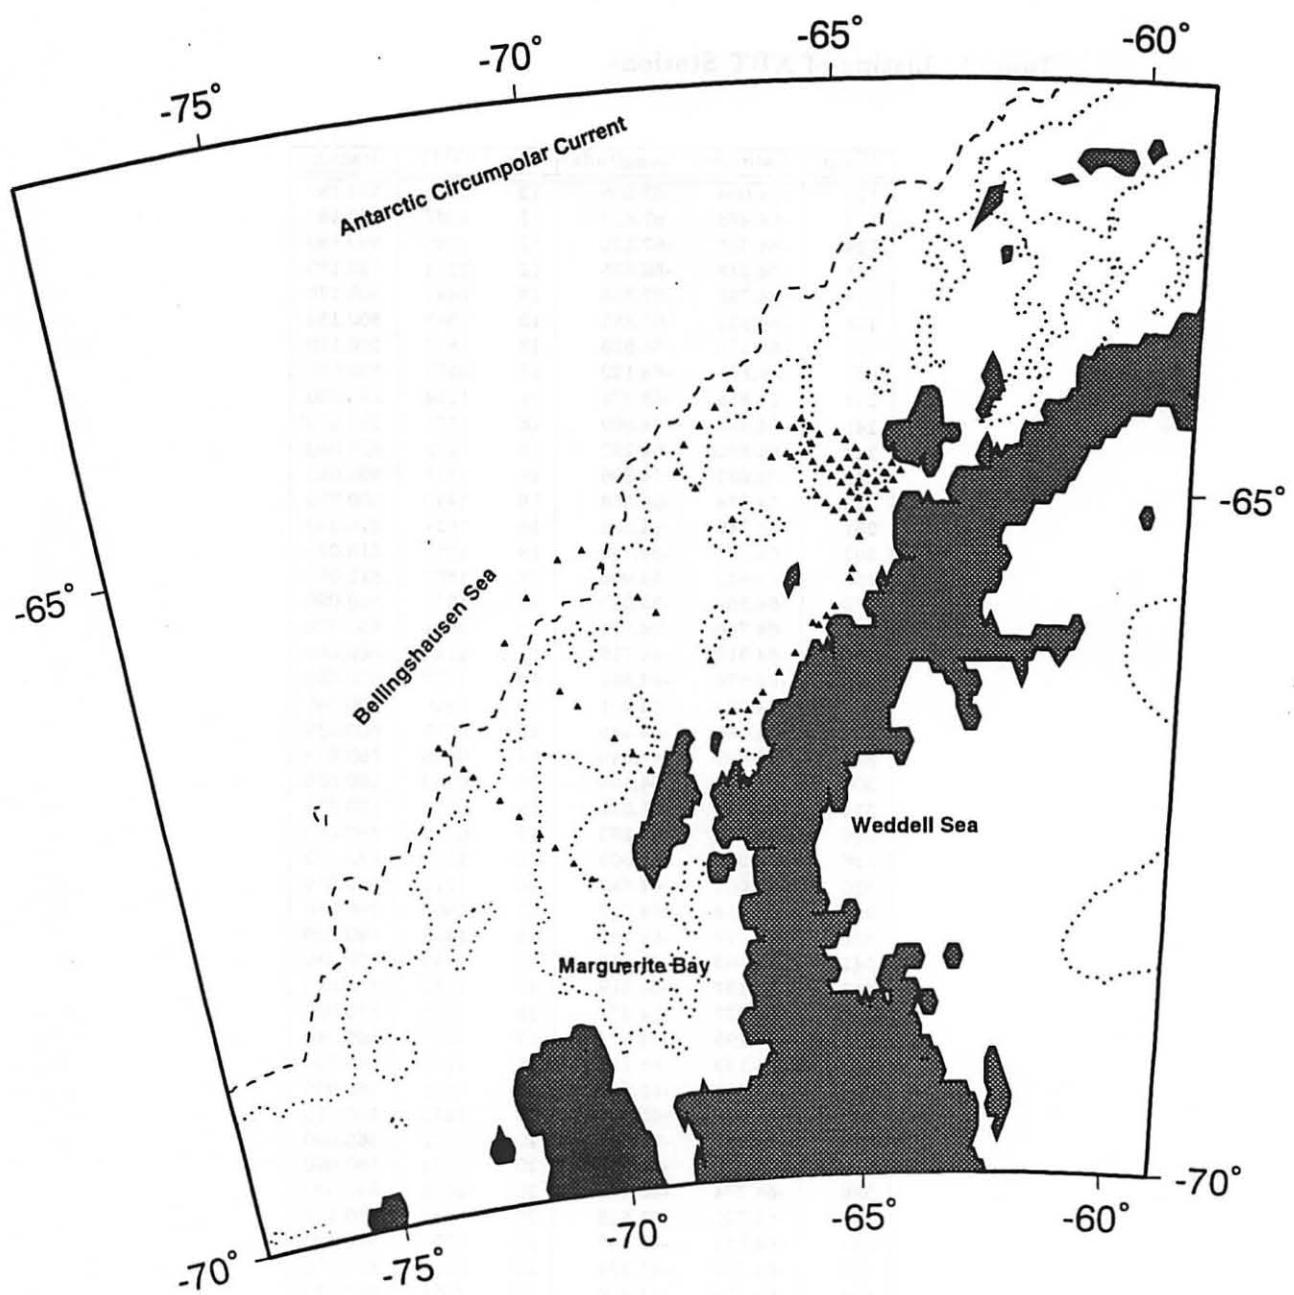

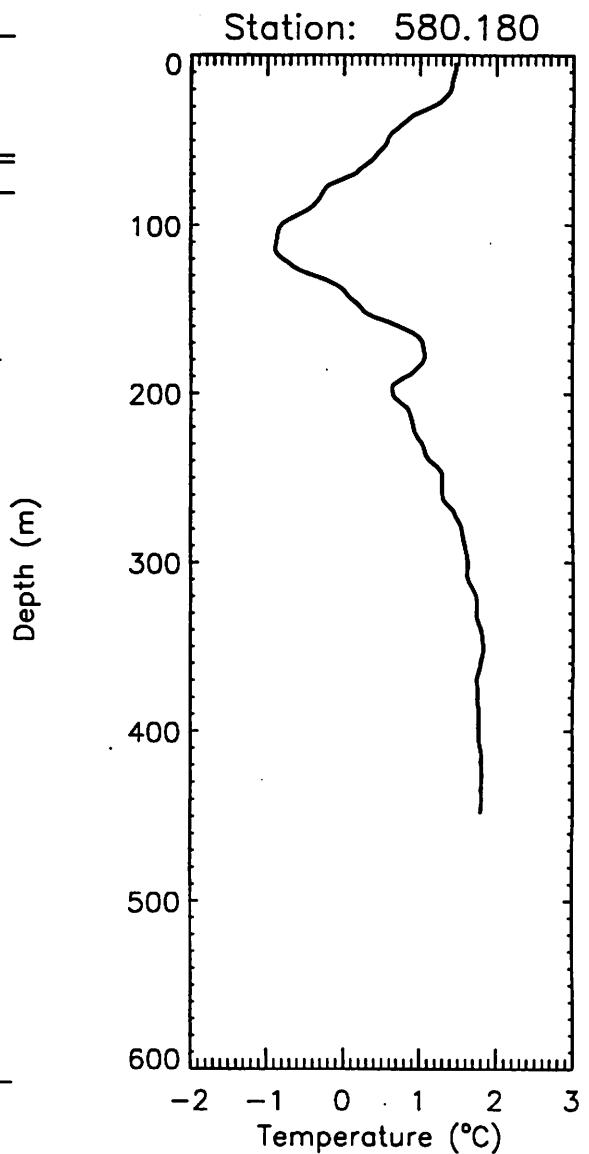

Figure 1. Distribution of XBT stations, indicated by triangles, occupied during the cruise. The 500 and 2000 meter isobaths are indicated by the dotted and dashed line, respectively. The southernmost and northernmost transect lines sampled during this cruise correspond to the 200 and 500 lines, respectively of the Palmer LTER peninsula-scale grid.
