## INTRODUCTION

From 25 March to 15 May 1993, a multidisciplinary cruise was conducted aboard the RV *Nathaniel B. Palmer* as part of the Palmer Long-Term Ecological Research (LTER) program off the Antarctic Peninsula. Stations were occupied at specified grid locations (Figure 1) within the Palmer LTER survey grid (Waters and Smith, 1992). The cruise departed from and returned to Punta Arenas, Chile.

Hydrographic data were collected on this cruise using two separate sampling devices, a Sea-Bird CTD system and a Bio-Optical Profiling System (BOPS). The measurements collected using the Sea-Bird CTD system are presented in a separate report (CCPO Technical Report No. 93-04). However, eight CTD casts were excluded from the CTD report and are appended to this BOPS report (see Appendix 1). Sampling and processing procedures used for these CTD casts are given in CCPO Technical Report No. 93-04.

This data report presents measurements collected using the BOPS sampling system, which was configured with a SeaBird CTD sensor to measure temperature, conductivity, and pressure; a BioSpherical PAR and spectral irradiance sensor; and a SeaTech fluorometer (for a complete description see Smith *et al.*, 1984 and Smith and Baker, 1984). The following reported variables were measured directly or derived from measured variables using BOPS: temperature, potential temperature, salinity, density, dynamic height, and Brunt-Väisälä frequency.

Upon return from the cruise, the BOPS data were initially processed at the Center for Remote Sensing and Environmental Optics at University of California, Santa Barbara. Final processing and report generation were completed at the Center for Coastal Physical Oceanography (CCPO) at Old Dominion University. Tapes of this data at one-meter resolution have been sent to the National Oceanographic Data Center.

## SAMPLING PROCEDURES

### *In Situ Data Collection*

The BOPS was used to collect 121 vertical profiles of temperature and conductivity at 114 stations within the Palmer LTER grid (Figure 1). The BOPS unit was lowered and raised at approximately  $30 \text{ m min}^{-1}$ . Observations were made to 500 meters or to within a few meters of the bottom for shallower stations. Data were collected on both down and up casts; down cast data were used to generate this report. A 12-place Rosette frame outfitted with 12 12-liter Go Flo bottles was lowered with the BOPS. The bottles were closed at selected depths on the up cast to obtain water for nutrient and biological analyses, as well as for calibration of the

BOPS salinity sensor. Horizontal spacing between the hydrographic stations was 20 km on most transects; alongshelf spacing between transects was 100 km.

#### *CTD Sensor Calibration*

The temperature and conductivity sensors on the CTD were subjected to pre- and post-cruise calibrations by Sea-Bird Electronics. The change in the temperature sensor between the two calibrations was  $0.0005^{\circ}\text{C mo}^{-1}$ . The change in the conductivity sensor was  $0.00006 \text{ Siemens m}^{-1} \text{ mo}^{-1}$ . Both of these changes are negligible and consequently no corrections were applied to the temperature or conductivity data presented in this report.

An additional check of the BOPS salinity values was provided by onboard salinity determinations of water collected with the Rosette. The water samples were processed using a Guildline Autosal inductive salinometer. Wormley Standard Seawater batch P114 was used to standardize the salinometer for all salinity determinations. Comparison of the bottle salinity samples (total of 44) with the BOPS-measured salinities gave a mean difference of 0.0029 with a standard deviation of  $\pm 0.0044$ . These observations support the decision of not applying a salinity correction to the BOPS-derived salinity measurements.

#### *Data Processing and Derived Quantities*

For each cast, the raw data (temperature and conductivity) from the BOPS were converted to engineering units and averaged into 1-meter depth bins. The conductivity data were corrected for thermal mass effects and pressure reversals. Data from the top 2 m of the water column were ignored due to sensor adjustment and rough surface conditions.

The procedures given in UNESCO (1983) were used to compute salinity from the temperature and conductivity data. Temperature and salinity profiles were plotted for each cast and visually inspected for consistency with acceptable, historical values for the region and for unrealistic spikes. All data were considered acceptable and no editing was performed. A 5-meter running average was applied to the temperature and salinity data to generate smoothed profiles for subsequent processing.

Potential temperature ( $\theta$ ) was determined from temperature profiles based on algorithms given in UNESCO (1983). The potential temperature and salinity data were used to calculate the density-related quantity,  $\sigma_0$ , which is the density anomaly for a water parcel that is moved adiabatically to the surface and was calculated using the International Equation of State of Seawater, 1980 as described in UNESCO (1983). Dynamic height values, reported in dynamic meters, were calculated relative

to the first depth bin closest to the surface. The Brunt-Väisälä frequency, which is a measure of water column stability, was calculated from the 1-db vertical profiles of potential density and density gradient at each station using the approach described in Fofonoff and Bray (1981).

As a final step, all data were interpolated, using a cubic spline, to the standard depths that are reported in the following tables.

## GRAPHICAL AND TABULAR DATA CHARACTERISTICS

A reference list of the 121 BOPS casts is presented in Table 1 which contains the cast or event number, latitude, longitude, Julian Day, GMT, and station.

The remainder of this data report presents graphical and tabular representations of station information and oceanographic measurements. Missing or questionable data values are denoted in these listings by -999. The information in the station table is as described below.

- Station and event numbers (in parenthesis to the right of the station number) are given for each station. The event number is an unique number assigned to each shipboard activity.
- The day of the BOPS cast is reported in Julian Days.
- Time for the BOPS cast is given in Greenwich Mean Time and corresponds to the time when the BOPS departed the surface on the down cast.
- Latitude and longitude locations correspond to the navigational fix, from the FURNO or ASHTECH GPS receiver system, at the time the BOPS cast started.
- Bottom depths were determined acoustically with an EK 500 Simrad system. At stations deeper than 3000 m, which is the limit for the EK 500, bottom depth is reported as -999.
- Meteorological variables were obtained from a Real-Time Data Acquisiton System. These data were acquired at six-second intervals and were averaged to one-minute intervals. The value reported for each variable corresponds to the time when the BOPS down cast started. Values are reported as:
  - Barometric pressure in millibars;
  - Relative humidity in %;
  - Air temperature in degrees Celsius;

- Relative humidity temperature in degrees Celsius;
- Wind speed in  $\text{m s}^{-1}$ ;
- Wind direction in degrees from North.

The second table given for each BOPS cast provides the following oceanographic variables as described below.

- Sample depth is given in meters at 5 m, 10-m intervals from 10 to 160 m and 20-m intervals from 160 to 500 m.
- *In situ* temperature is given in degrees Celsius.
- Salinity is based on the practical salinity scale.
- Potential temperature is given in degrees Celsius.
- Density is given as  $\sigma_0$  and is reported as  $\text{kg m}^{-3}$ .
- Dynamic height is given in dynamic meters.
- Brunt Väisälä frequency is given in  $\text{rad}^2 \text{ sec}^{-2}$ .

The graphical presentation consists of vertical profiles of temperature (solid line) and salinity (dotted line) for each station to 500 meters. Also shown are potential temperature-salinity diagrams for each station. The symbols on the potential temperature-salinity curves are provided as reference points and correspond to depths of 50 m, 100 m, and 200 m.

#### ACKNOWLEDGMENTS

This work was supported by the National Science Foundation grant DPP-9011927. We thank Vicki Menzies, Tim Newberger, Charleen Johnson, and Braden Seely for assistance in field collection.

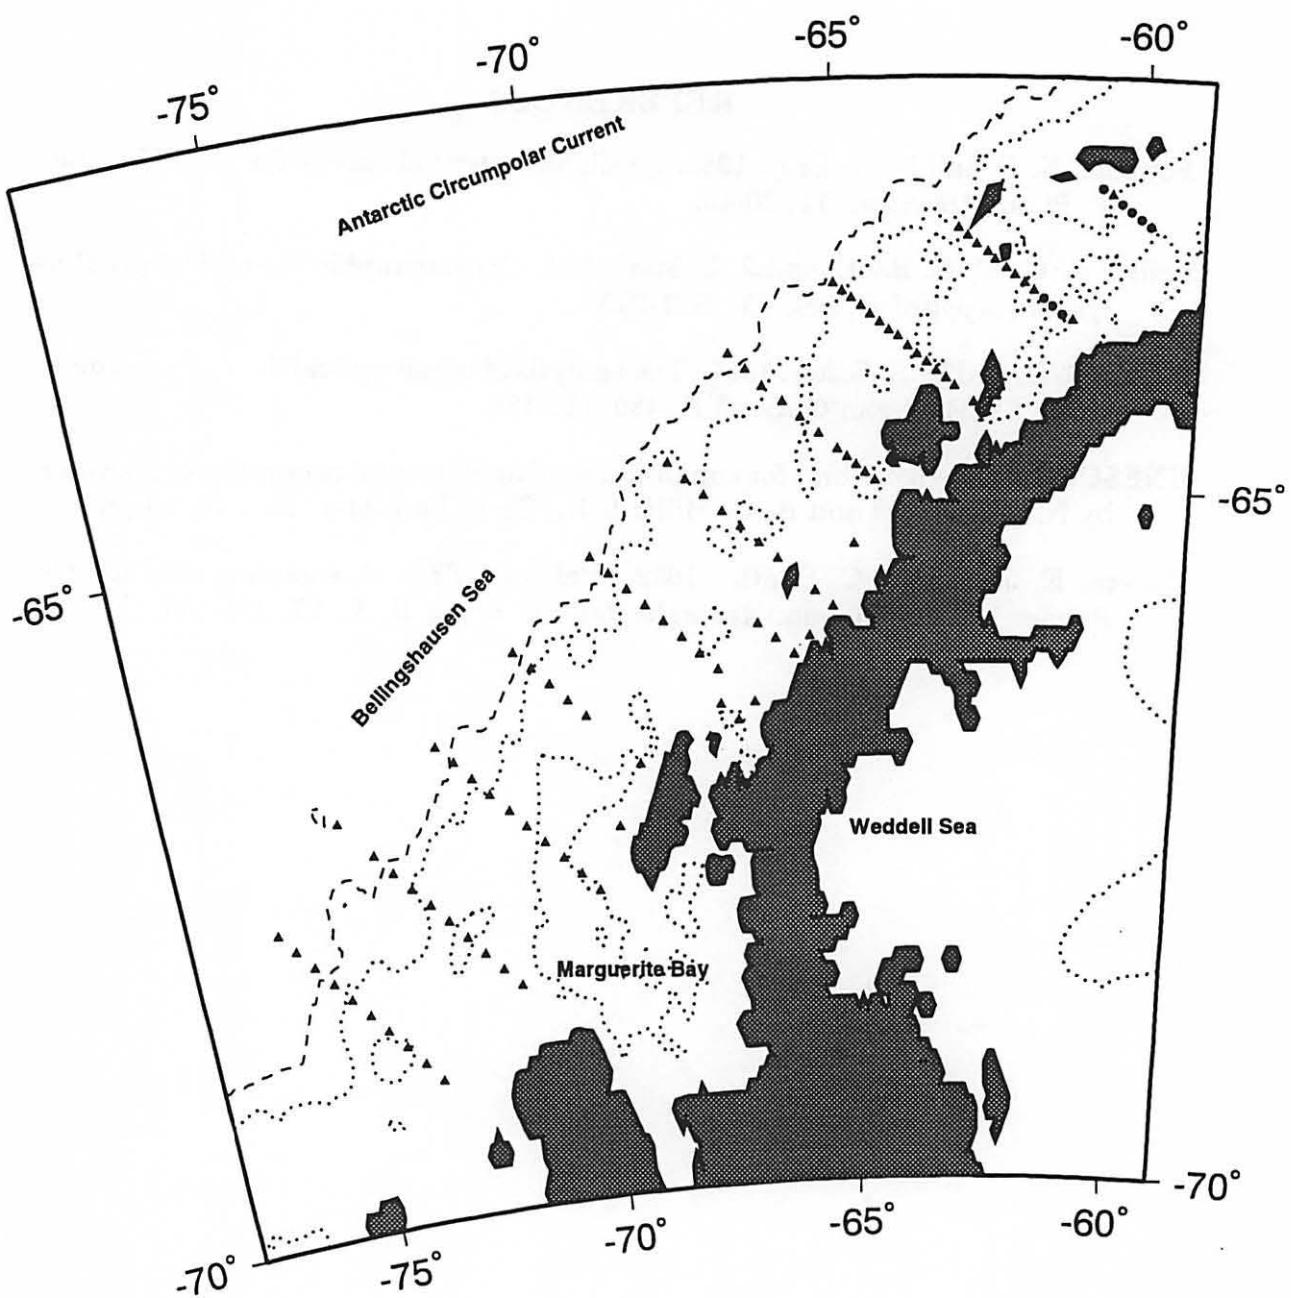

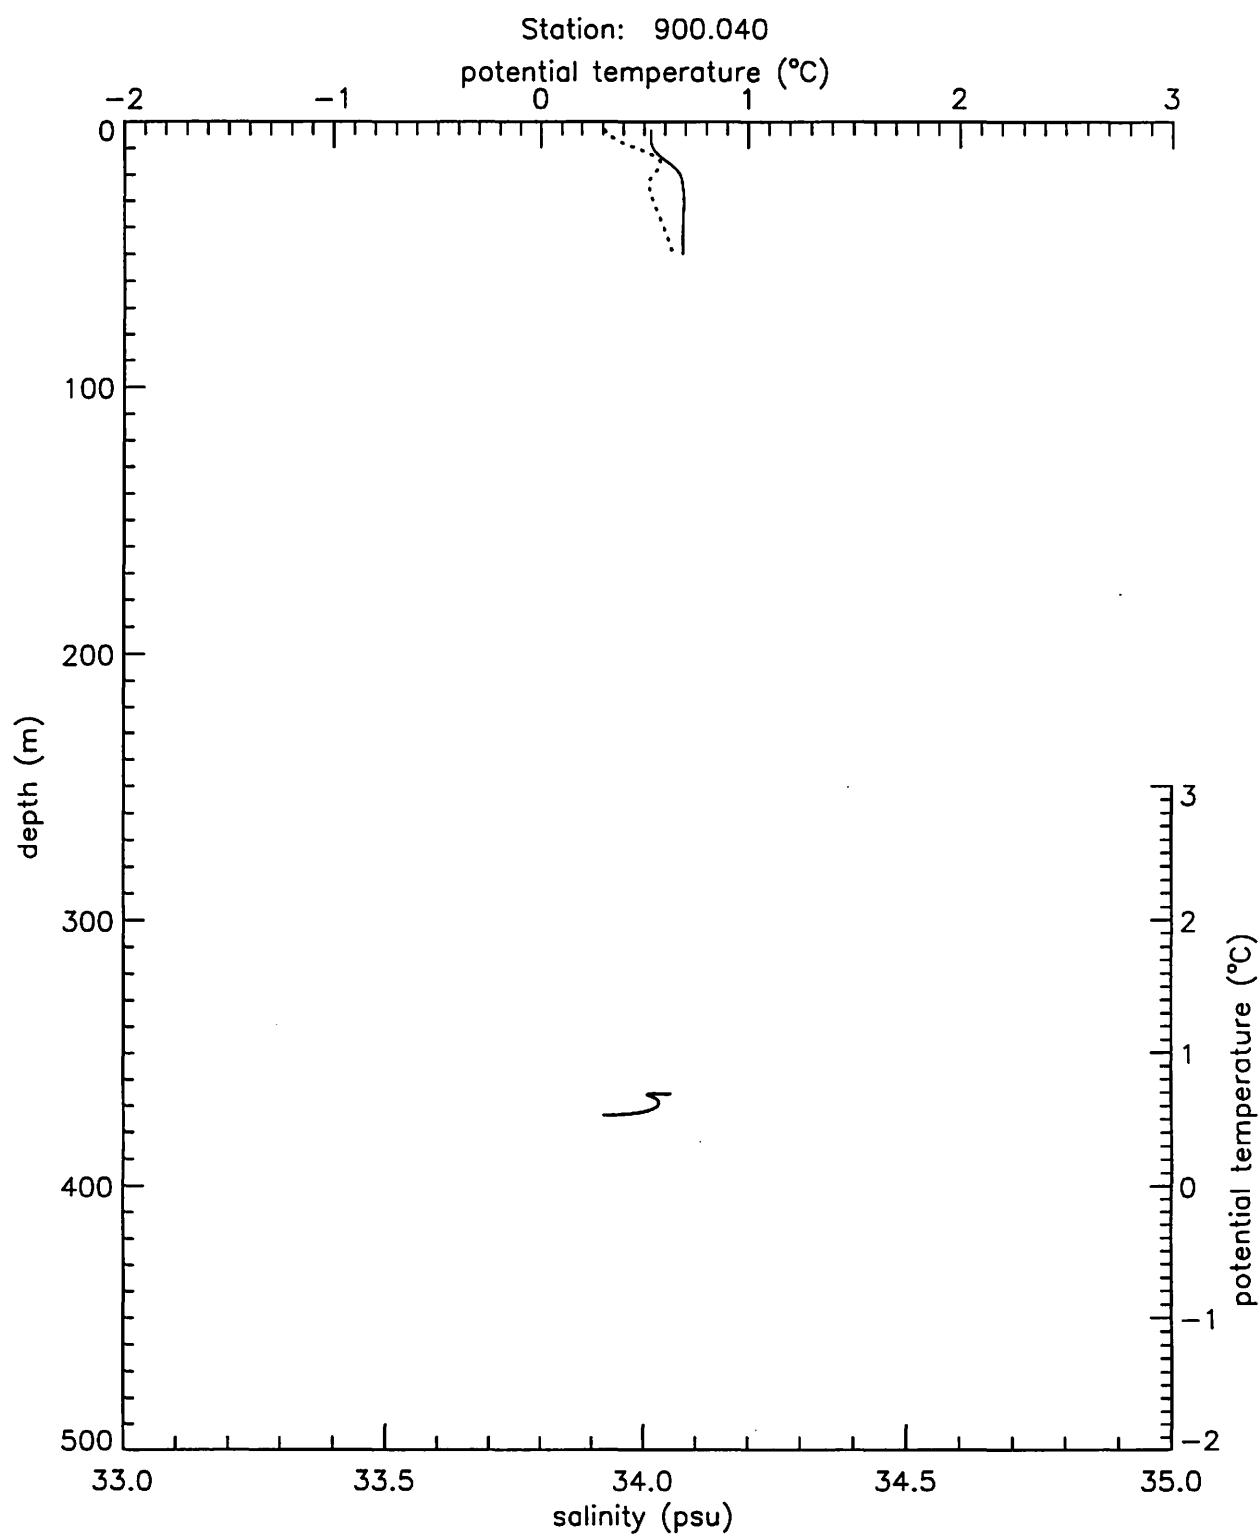

Figure 1. Distribution of BOPS stations, indicated by triangle, and CTD stations, indicated by circle, occupied during the March - May 1993 LTER cruise. BOPS casts were also made at the eight CTD stations. The 500 and 2000 meter isobaths are indicated by the dotted and dashed line, respectively. The southernmost and northernmost transect lines sampled during this cruise correspond to the 000 and 900 lines, respectively of the Palmer LTER peninsula-scale grid.
