## INTRODUCTION

From 23 August to 30 September 1993, a multidisciplinary cruise was conducted aboard the *RV Polar Duke* as part of the Palmer Long-Term Ecological Research (LTER) program off the Antarctic Peninsula. Stations were occupied at specified grid locations (Figure 1) within the Palmer LTER survey grid (Waters and Smith, 1992). The cruise departed and returned to Punta Arenas, Chile.

Oceanographic data were collected using a Bio-Optical Profiling System (BOPS) (for a complete description see Smith *et al.*, 1984 and Smith and Baker, 1984). The BOPS package was configured with a SeaBird CTD sensor to measure temperature, conductivity, and pressure; a BioSpherical PAR and spectral irradiance sensor; and a SeaTech fluorometer. The first portion of this report presents the hydrographic data collected with the CTD system on the BOPS. The following measured and derived quantities are reported: temperature, potential temperature, salinity, density, dynamic height, and Brunt-Väisälä frequency.

Upon return from the cruise, the CTD measurements from the BOPS were processed initially at the Center for Remote Sensing and Environmental Optics at the University of California, Santa Barbara. Final processing and report generation were completed at the Center for Coastal Physical Oceanography (CCPO) at Old Dominion University.

This report also contains temperature data collected using a Sippican, Inc. MK-12 expendable bathythermograph (XBT) system. Upon return from the cruise, the XBT data were processed by LTER personnel at CCPO.

Tapes of both the BOPS and XBT data sets at one-meter resolution have been sent to the National Oceanographic Data Center.

The temperature and conductivity sensors on the BOPS CTD system were subjected to pre- and post-cruise calibrations by SeaBird Electronics. The change in the temperature sensor between the two calibrations was  $0.0005^{\circ}\text{C mo}^{-1}$ . The change in the conductivity sensor was  $0.00006 \text{ Siemens m}^{-1} \text{ mo}^{-1}$ . Both of these changes are negligible and consequently no corrections were applied to the temperature or conductivity data presented in this report.

## SAMPLING PROCEDURES AND QUALITY ASSURANCE

### *BOPS Data Collection and Processing*

The BOPS was used to collect 60 vertical profiles of temperature and conductivity at 42 stations within the Palmer LTER grid (Figure 1). Of the original 60 profiles, 55 yielded good data which are presented in this report. Observations were

made to 500 meters or to within a few meters of the bottom at stations shallower than 500 meters. The BOPS unit was lowered and raised at approximately 30 m min<sup>-1</sup>. Data were collected on both down and up casts; whenever possible down cast data were used to obtain the hydrographic quantities.

A 12-place rosette frame, outfitted with 12 12-liter Go Flo bottles, was lowered with the BOPS. The bottles were closed at selected depths on the up cast to obtain water for nutrient and biological analyses. Horizontal spacing between the hydrographic stations was 20 km on most transects; alongshelf spacing between transects was 100 km.

For each cast, the raw data (temperature and conductivity) from the BOPS were converted to engineering units and averaged into 1-meter depth bins. The conductivity data were corrected for thermal mass effects and pressure reversals. Data from the top 2 m of the water column were ignored due to sensor adjustment and rough surface conditions.

The procedures given in UNESCO (1983) were used to compute salinity from the temperature and conductivity data. Temperature and salinity profiles were plotted for each cast and visually inspected for consistency with acceptable, historical values for the region and for unrealistic spikes. Unrealistic low salinities, probably caused by ice crystals in the conductivity sensor, resulted in editing of the upper portion of 7 salinity profiles. For these profiles, the first realistic salinity value was used for calculation of derived variables in the upper water column. The stations at which this was done were characterized by a deep, well-mixed surface layer. Thus, the editing resulted in little, or no bias in the derived hydrographic quantities. Twelve of the down casts could not be edited in this fashion; thus, up cast data were substituted at these stations. A summary of the stations at which editing or substitution of data was done is given in Table 1. Five of the original 60 BOPS casts had temperature or salinity values for both the up and down casts which could not be edited. These stations are not included in this report.

A 5-meter running average was applied to the temperature and salinity data to generate smoothed profiles for further processing. Potential temperature ( $\theta$ ) was determined from temperature profiles based on algorithms given in UNESCO (1983). The potential temperature and salinity data were used to calculate the density-related quantity,  $\sigma_0$ , which is the density anomaly for a water parcel that is moved adiabatically to the surface and was calculated using the International Equation of State of Seawater, 1980 as described in UNESCO (1983). Dynamic height values, reported in dynamic meters, were calculated relative to the first depth bin closest to the surface. The Brunt-Väisälä frequency, which is a measure of water column stability, was calculated from the 1-db vertical profiles of potential density and density gradient at each station using the approach described in Fofonoff and Bray (1981).

As a final step, all data were interpolated, using a cubic spline, to the standard depths that are reported in the following tables.

#### *XBT Data Collection and Processing*

XBT drops were made at 38 stations, of which 33 provided good data. Sippican probes, either T-6 (nominal maximum depth: 460 m) or T-7 (nominal maximum depth: 760 m), or Sparton probes T-5 (nominal maximum depth: 1800 m) were used. All XBTs were deployed from a either hand-held launcher or ship mounted launcher, while the ship was underway. The raw voltage data were logged to a computer disk file under the control of the MK-12 hardware and software configuration provided by Sippican, Inc. In general, the horizontal spacing of the the XBT stations was 20 km on most transects; alongshelf spacing between transects was 100 km. Two XBT transects with spacing of about 2 km were made across the shelf break on the northernmost section of the LTER study region (Figure 1).

The raw voltage data were converted using MK-12 post-processing software to generate vertical profiles of temperature (degrees Celsius). Each profile was plotted and visually inspected. Bad XBT casts were identified and eliminated by comparing the XBT-derived temperature with known ranges for the study region. Typically, the temperatures within the top few meters were unrealistic due to the initial adjustment of the XBT thermistor to the cold water. Thus, the top 5 meters of each XBT cast were deleted. The remaining data were smoothed with a 5-meter running average and interpolated using a cubic spline to the standard depths that are reported in the following tables.

## GRAPHICAL AND TABULAR DATA CHARACTERISTICS

A reference list of all 55 BOPS and 33 XBT casts is presented in Table 1, which contains the cast event number, station latitude and longitude, Julian day, Greenwich Mean Time, station number, and data type (BOPS or XBT). The final column indicates if the station profiles were edited or if up cast data were substituted for the down cast data. No comment indicates that the original down cast data were used.

The remainder of the data report presents graphical and tabular representations of station information and oceanographic measurements.

### *BOPS Data*

For each BOPS cast, a table of station information is provided as described below.

- Station and event numbers (in parenthesis to the right of the station number) are given for each station. The event number is an unique number assigned to each shipboard activity.
- The day of the BOPS cast is reported in Julian Days.
- Time for the BOPS cast is given in Greenwich Mean Time and corresponds to the time when the BOPS departed the surface on the down cast.
- Latitude and longitude locations correspond to the navigational fix, from the FURNO GPS receiver system, at the time the BOPS cast started.
- Bottom depths were determined acoustically with the 50kHz Digitrak system on board the ship. A value of -999 is reported when depth information was missing.

The second table given for each BOPS cast provides the oceanographic variables as described below.

- Sample depth is given in meters at 5 m, 10-m intervals from 10 to 160 m and 20-m intervals from 160 to 500 m.
- *In situ* temperature is given in degrees Celsius.
- Potential temperature is given in degrees Celsius.
- Salinity is based on the practical salinity scale.
- Density is given as  $\sigma_0$  and is reported as  $\text{kg m}^{-3}$ .

- Dynamic height is given in dynamic meters.
- Brunt Väisälä frequency is given in  $\text{rad}^2 \text{ sec}^{-2}$ .

The graphical presentation consists of vertical profiles of temperature (solid line) and salinity (dotted line) for each station to 500 meters. Also shown are potential temperature-salinity diagrams for each station. The symbols on the potential temperature-salinity curves are provided as reference points and correspond to depths of 50 m, 100 m, and 200 m.

#### *XBT Data*

For each XBT cast, a table of station information is provided as described below.

- Station and event numbers (in parenthesis to the right of the station number) are given for each station.
- Latitude and longitude locations correspond to the navigational fix, from the FURNO GPS receiver system, at probe launch time.
- Bottom depths in meters were determined acoustically with the 50kHz Digitrak system available on the ship. A value of -999 is reported when depth information was missing.
- The day the station was occupied is reported in Julian Days.
- Time is given in Greenwich Mean Time and corresponds to probe launch time.

The second table for each station provides the temperature, given in degrees Celsius at:

- 10-m intervals from 5 to 160 m,
- 20-m intervals from 160 to 500 m,
- 50-m intervals deeper than 500 m, and
- the last depth sampled.

For each station, a vertical profile of temperature is given to 1000 meters. At stations where the XBT data extended below 1000 meters, the temperature values are given in the corresponding table.

## ACKNOWLEDGMENTS

This work was supported by the National Science Foundation grant DPP-9011927. Thanks are extended to Cole Mather, Mark Cochrane and the crew of the *RV Polar Duke* for assistance in data collection.
